## **SKILL SET**

|                                   |                                                                            |
|-----------------------------------|----------------------------------------------------------------------------|
| <b>Languages &amp; Frameworks</b> | Typescript, Solidity, Node.js, Next.js, web3.js, React, React Native, Rust |
| <b>Development Tools</b>          | Git, Docker, Hardhat, Foundry, Truffle, Electron, Expo                     |
| <b>Databases &amp; Datastores</b> | Postgres, IPFS, MySQL, NoSQL, Redis, Memcache, Mongo, Prisma               |
| <b>Platforms</b>                  | AWS, Vercel, Ethereum, Palm, Solana/SVM                                    |
| <b>Web3</b>                       | DAOs, L2, ERC20, 721 1155, Account Abstraction, L1/L2 Settlement, ZK's     |

## **PROFESSIONAL EXPERIENCE**

### ***Founding Engineer at Burn***

***October 2022 - Current***

- Built cross-platform mobile app (iOS/Android) with React Native, Expo, Next.js backend, and PostgreSQL
- Integrated GPT-4V to analyze meal photos and extract calories, macros, and health scores automatically
- Implemented personalized nutrition algorithms for TDEE, macro targets, and exercise calorie tracking
- Designed image processing pipeline with compression and cloud storage via Vercel Blob
- Built passwordless auth with Google and Apple oauth signin + JWTs for persistence

### ***Founding Engineer at Nifty's***

***May 2021 - October 2022***

- Engineered and optimized high-throughput contracts for 100k+ mints of NTFs
- Launched a rank leaderboards contract
- Fully automated contract deployment to testnet and mainnet on Ethereum and Palm
- Automatically verified contracts upon deployed to any network
- Explored cryptoeconomic solutions to our ERC20 token
- Setup staging and mainnet environments for easier testing and release schedules

### ***Founding Engineer at Hypernet Labs***

***February 2019 - February 2020***

- Architected a layer two state channel solution for high-fidelity ledgering and settlement, scaling unidirectional ERC20 payments to 25 TPS.
- Combined several cryptoeconomic primitives to create an incentive-aligned and revenue-generating DAO
- Implemented a dependency injection design pattern in protocol SDK to allow for modular utilization and testing of the protocol's layers, services, and business logic
- Setup CI/CD pipelines for continuous testing and deployment of the protocol and SDK
- Directly managed a small team of engineers, overseeing technical roadmaps and career development while scaling the engineering department

### ***Founding Engineer at i2Chain***

***September 2018 - February 2019***

- Created a cross platform desktop application using the electron framework that utilizes react, redux, flow, thunk, javascript, web3, html, and css
- Implemented identity based access control in node.js to securely share information across any domain
- Architected and deployed production ready proof-of-authority cluster of geth nodes behind a round-robin load balancer
- Increased employee productivity by introducing agile/scrum practices to the team. This involved leading daily stand ups, backlog grooming, estimations, sprint reviews, and retrospectives.
- Built serverless applications with AWS Lambda to reduce operational costs and address scalability

### ***Blockchain Consultant***

***September 2017 - September 2018***

- Architected, developed, and launched solidity-based settlement smart contracts handling hundreds of millions in value
- Advising for companies collectively worth hundreds of millions; public examples include Stentor.io, Trade.io, Sapien Network, APT Systems Inc, Butlr, and Light Network.

## **EDUCATION**

***University of California, Davis (B.S. in Computer Science)***

***September 2012 - June 2017***
